

Abstract

[69] In accordance with one embodiment of the present invention, an oral cleaning device is provided with a nozzle to jet a pressurized liquid. The oral cleaning device has a body and a neck/head assembly extending from the body. The oral cleaning device further includes a refillable reservoir defined by the body for holding a liquid. An on-board pump is used to pressurize the liquid contained in the reservoir. The oral cleaning device further includes a channel from the reservoir to the nozzle in the neck/head assembly such that when pressurized fluid in the reservoir is released, the fluid jets from the oral cleaning device. The neck/head assembly is also interchangeable with other neck/head assemblies to provide different cleaning features, such as disposable flossing heads or misting nozzles.
